

In Egypt, the yearly average for Malaria's deaths was only two persons, While the daily average was 0.01. and that's mean it's almost nothing comparing to the annual average overall in Africa that I notice once I clicked on Egypt on the map, and it shows me around 13000 deaths.

On the other hand, I clicked on another country in Africa and it showed me that the yearly deaths is about 3041 Which is roughly a third of the average in Africa with daily average of 8.33 Which is considered very bad compared to Egypt, where it is approximately eight and a half times, but it is good for the average in Africa as a whole.

Finally, I clicked on the Congo, the situation there was even worse between the three country the I'm Comparing them, While the yearly average was 15203, the daily average was 41.65. This is about forty-two times compared to Egypt which indicate it's the worst scenario over all the three country and the government should take some action and precautions to prevent the situation from deteriorating even further.
